

Figure: Participant entry into the SQUEEZE trial and flow through the protocol

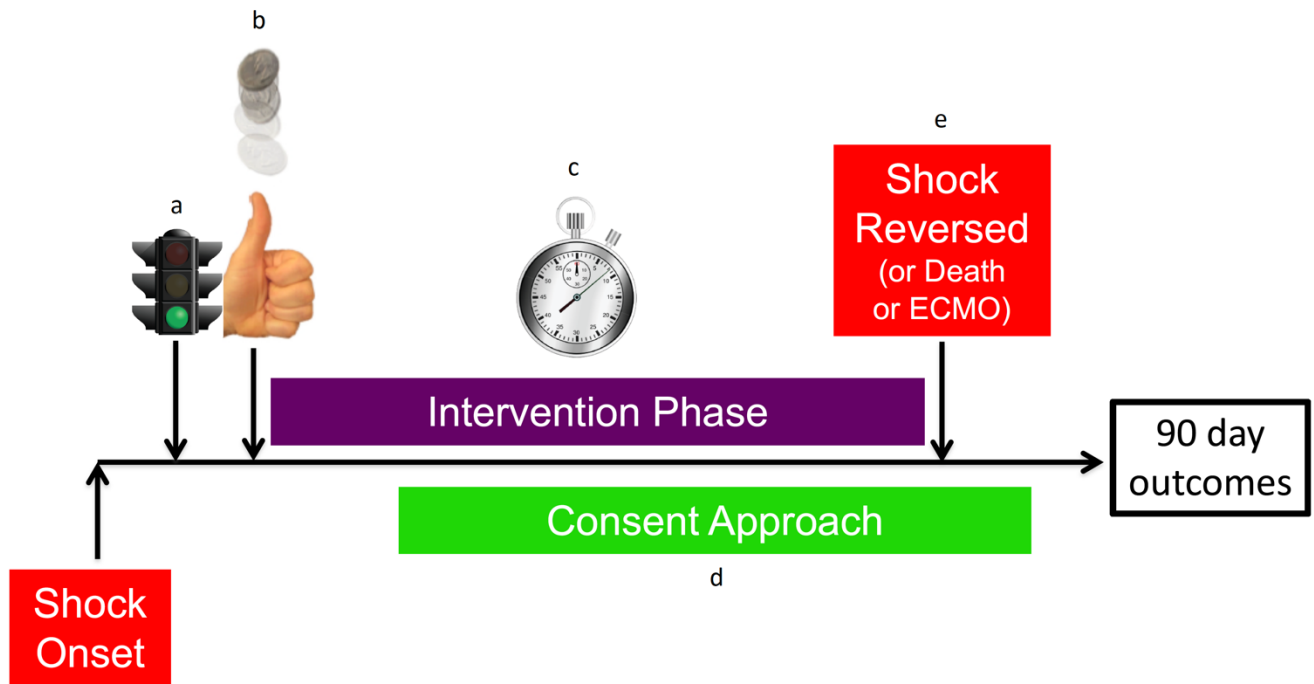

Figure Caption

- a. Eligibility criteria met
- b. Participant randomized
- c. Intervention phase begins at allocation and ends at shock-reversal, or alternatively at death or initiation of mechanical circulatory support (most commonly Extracorporeal Membrane Oxygenation, ECMO) while still in shock.
- d. The trial uses an 'exception to consent' (deferred consent) model. Consent approach is therefore always following randomization.
- e. Date and time of shock-reversal is determined according to study definitions.
