## **Background**

we address the critical issue of parameterization of geometrical structures for the purpose of layout-based design, in particular automated EM optimization using HP HFSS

advances in computer hardware and software make EM optimization feasible through HP HFSS Designer, though still very CPU intensive for moderate size design problems

as algorithms and computers become faster we expect wider use of EM optimization in the future

## **Introduction**

Geometry Capture facilitates user-parameterization, through graphical means, of arbitrary 2D and 3D geometrical structures

this makes it possible to optimize the shape and dimensions of geometrical objects

HP HFSS Designer performs optimization through automatically adjusting the user-defined parameters

Geometry Capture permits the implementation of explicit numerical bounds and implicit geometrical constraints

as the optimization process proceeds, revised structures must be automatically generated

each structure must be physically meaningful and should follow the designer's intention w.r.t. allowable modifications and possible limits

we leave the parameterization process to the user

## **Geometry Capture**

a technical breakthrough for parameterization of arbitrary structures for EM optimization

a user-friendly tool to establish the mapping between the designable parameter values and the geometrical layout coordinates

automatic translation of the values of user-defined designable parameters to the layout description in terms of absolute coordinates

automatic translation of each new set of parameter values before invoking HP HFSS during optimization without the need of any schematic interruption

parameterizable parameters

- geometrical parameters
- dielectric layer parameters
- metallization parameters

## **Assigning Optimization Parameters**

the choice of designable (optimization) parameters should be left to the designer

designers know best what changes to the object are desired and allowable

the process is intuitive and depends on experience, but some rules should be followed

- select as few optimization parameters as possible

- the optimization parameters must be consistent

- understand the evolution of the designable object

the parameter values, as seen by the optimizer, are intermediate to the process of generating actual layouts

parameter transformations such as scaling or normalization can be used to link the optimization parameters with the actual layout design parameters

## Various Object Evolutions

(a)

(b)

(c)

(d)

- (a) initial geometry
- (b) proportional expansion of the whole structure along the  $x$  axis
- (c) only the location of the slit in the fixed line is allowed to change
- (d) only the segment to the right of the slit is allowed to expand

## Evolution of a Rectangle to a Tapered Line

one parameter controls the length of the right edge in a symmetric manner

## Steps Example

we consider an element called “steps”, which has both dependent and independent parameters

there is “nominal” project called “steps\_0” and two perturbed or incremental projects called “steps\_1” and “steps\_2”

there are many different ways of formulating parameterization in this example: only one such way is illustrated here

steps\_1 varies an independent parameter  $H_1$

steps\_2 varies an independent parameter  $L_2$

there are two dependent parameters  $H_2$  and  $L_1$

## Dependent Parameter $H_2$

consider an independent optimization parameter  $H_1$

initial geometry  $H_1 = 6$  ( $H_2 = 8$ )

incremental geometry  $H_1 = 7$  ( $H_2 = 9$ )

possible outcome  $H_1 = 5$  ( $H_2 = 7$ )

here  $4 < H_1 < 9$ ,  $6 < H_2 < 11$ ,  $H_2 = H_1 + 2$

**Dependent Parameter  $L_1$**

consider an independent optimization parameter  $L_2$

initial geometry  $L_2 = 5$  ( $L_1 = 6$ )

incremental geometry  $L_2 = 6$  ( $L_1 = 5$ )

possible outcome  $L_2 = 9$  ( $L_1 = 2$ )

here  $0 < L_1 < 11$ ,  $0 < L_2 < 11$ ,  $L_1 + L_2 = 11$

# Geometry Capture Form Editor for Steps Example

The screenshot shows a window titled "Empipe3D - steps" with a menu bar containing "Options", "Load", "Save", "Optimize", and "Exit". Below the menu bar, there is a "Nominal Project:" field with the value "steps\_0". A table lists optimization parameters:

Parameter Name	Project Name	Nominal Value	Perturbed Value	# of Divs	Unit Name
H1	steps_1	6	7	2	cm
L2	steps_2	5	6	2	cm

# Window for Selecting Optimization Parameters and Bounds for Steps Example

The screenshot shows a window titled "Empipe3D Select Variables" with a menu bar containing "Mark All", "Unmark All", "Go", and "Cancel". Below the menu bar, there are two buttons: "Remove Database" and "Save HFSS Project". A table lists optimization parameters with checkboxes and input fields for their bounds:

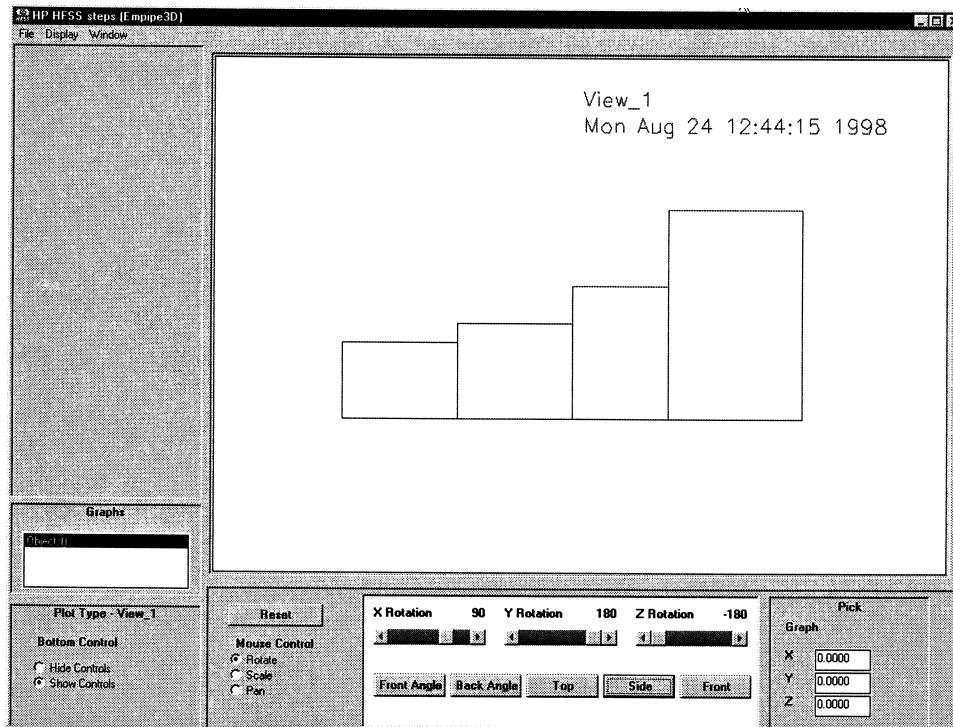

Variable?	Unit	Lower Bound	Value	Upper Bound
<input checked="" type="checkbox"/> H1	cm	<input type="text"/>	6	<input type="text"/>
<input checked="" type="checkbox"/> L2	cm	<input type="text"/>	5	<input type="text"/>

## Window Showing Possible Outcome $H_1 = 5$

Empipe3D Select Variables					
Mark All		Unmark All		Go	Cancel
Remove Database			Save HFSS Project		
Variable?	Unit	Lower Bound	Value	Upper Bound	
<input checked="" type="checkbox"/> H1	cm		5		
<input checked="" type="checkbox"/> L2	cm		5		

## Corresponding Solid Model

notice that  $H_2 = H_1 + 2 = 7$

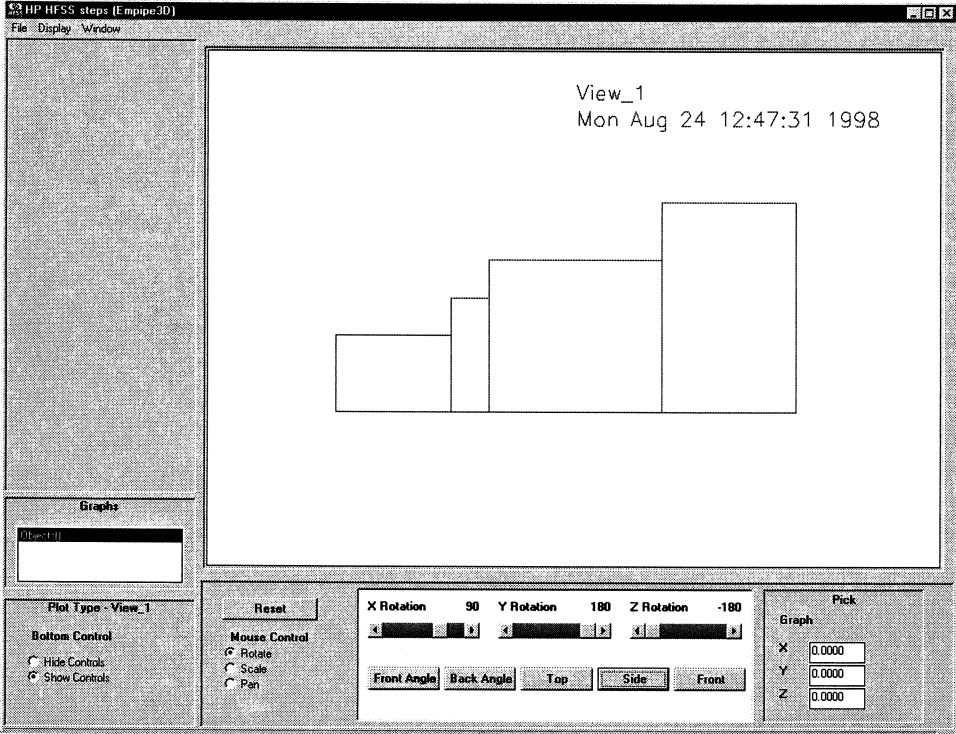

# Window Showing Possible Outcome $L_2 = 9$

Empipe3D Select Variables				
<input type="button" value="Mark All"/>		<input type="button" value="Unmark All"/>		<input type="button" value="Go"/>
<input type="button" value="Remove Database"/>		<input type="button" value="Save HFSS Project"/>		
Variable?	Unit	Lower Bound	Value	Upper Bound
<input checked="" type="checkbox"/> H1	cm		6	
<input checked="" type="checkbox"/> L2	cm		9	

## Corresponding Solid Model

notice that the overall length remains constant with value 11

## **Discretization of Optimization Parameters**

parameter discretization is desirable to take advantage of techniques that facilitate efficiency

utilization of a data base of already simulated structures

efficient response interpolation and modeling

efficient gradient evaluation, handling of tolerances,  
efficient model evaluation in Monte Carlo analysis and  
yield-driven design

## **Conclusions**

we presented the concept of parameterization of arbitrary geometrical structures for automated layout-based design using HP HFSS

certain assumptions keep the technique simple and manageable

parameterized structures can be saved and reused
