

## Appendix 1: Methods

### Background to the rapid synthesis

This rapid synthesis mobilizes both global and local research evidence about a question submitted to the McMaster Health Forum's Rapid Response program. Whenever possible, the rapid synthesis summarizes evidence drawn from existing evidence syntheses and from single research studies in areas not covered by existing evidence syntheses and/or if existing evidence syntheses are old or the science is moving fast. A systematic review is a summary of studies addressing a clearly formulated question that uses systematic and explicit methods to identify, select and appraise research studies, and to synthesize data from the included studies. The rapid synthesis does not contain recommendations, which would have required the authors to make judgments based on their personal values and preferences.

The Forum produces timely and demand-driven contextualized evidence syntheses such as this one that address pressing health and social system issues faced by decision-makers (see [our website](#) for more details and examples). This includes evidence syntheses produced within:

- days (e.g., rapid evidence profiles or living evidence profiles)
- weeks (e.g., rapid syntheses that at a minimum include a policy analysis of the best-available evidence, which can be requested in a 10-, 30-, 60- or 90-business-day timeframe)
- months (e.g., full evidence syntheses or living evidence syntheses with updates and enhancements over time).

This rapid synthesis was prepared over a 30-business day timeframe and involved five steps:

- 1) submission of a question from a policymaker or stakeholder (in this case, Canadian Partnership Against Cancer)
- 2) identifying, selecting, appraising and synthesizing relevant research evidence about the question
- 3) conducting and synthesizing a jurisdictional scan of experiences about the question from other countries and Canadian provinces and territories
- 4) drafting the rapid synthesis in such a way as to present concisely and in accessible language the research evidence
- 5) finalizing the rapid synthesis based on the input of at least two merit reviewers.

### Identification, selection, quality appraisal and synthesis of evidence

For this rapid synthesis, we searched Health Systems Evidence (Search [1](#) and [2](#)), PubMed (Search [1](#)) for:

- 1) guidelines (defined as providing recommendations or other normative statements derived from an explicit process for evidence synthesis)
- 2) evidence syntheses
- 3) protocols for evidence syntheses that are underway
- 4) single studies (when no guidelines or evidence syntheses are identified or when they are older).

In Health Systems Evidence, we searched for evidence syntheses on 21 August 2023 using the terms “cancer care pathway” and “cancer care transition”. In PubMed, we searched for evidence syntheses and primary studies on 21 August 2023 using cancer AND (transition or pathway) AND primary care AND (access OR coordination).

## Approaches to Support Transitions into and out of Cancer Care Systems for Patients Who Do Not Have a Primary-Care Provider

13 October 2023

[MHF product code: RS 112]

Additional handsearching was conducted through an [evidence brief](#) on cancer care transitions and by searching for relevant CanIMPACT studies.

Each source for these documents is assigned to one team member who conducts hand searches (when a source contains a smaller number of documents) or keyword searches to identify potentially relevant documents. A final inclusion assessment is performed both by the person who did the initial screening and the lead author of the rapid synthesis, with disagreements resolved by consensus or with the input of a third reviewer on the team. The team uses a dedicated virtual channel to discuss and iteratively refine inclusion/exclusion criteria throughout the process, which provides a running list of considerations that all members can consult during the first stages of assessment.

For any included guidelines, two reviewers assess each guideline using three domains in the AGREE II tool (stakeholder involvement, rigour of development and editorial independence). Guidelines are classified as high quality if they were scored as 60% or higher across each of these domains.

For each evidence synthesis we included, we documented the dimension of the organizing framework (see Appendix 3) with which it aligns, key findings, living status, methodological quality (using AMSTAR), last year the literature was searched (as an indicator of how recently it was conducted), availability of GRADE profile, and equity considerations using PROGRESS PLUS.

For AMSTAR, two reviewers independently appraise the methodological quality of evidence syntheses that are deemed to be highly relevant. Disagreements are resolved by consensus with a third reviewer if needed. AMSTAR rates overall methodological quality on a scale of 0 to 11, where 11/11 represents a review of the highest quality. High-quality evidence syntheses are those with scores of eight or higher out of a possible 11, medium-quality evidence syntheses are those with scores between four and seven, and low-quality evidence syntheses are those with scores less than four. It is important to note that the AMSTAR tool was developed to assess evidence syntheses focused on clinical interventions, so not all criteria apply to those pertaining to health-system arrangements or to economic and social responses. Where the denominator is not 11, an aspect of the tool was considered not relevant by the raters. In comparing ratings, it is therefore important to keep both parts of the score (i.e., the numerator and denominator) in mind. For example, an evidence synthesis that scores 8/8 is generally of comparable quality to another scoring 11/11; both ratings are considered 'high scores.' A high score signals that readers of the evidence synthesis can have a high level of confidence in its findings. A low score, on the other hand, does not mean that the evidence synthesis should be discarded, merely that less confidence can be placed in its findings and that it needs to be examined closely to identify its limitations. (Lewin S, Oxman AD, Lavis JN, Fretheim A. SUPPORT Tools for evidence-informed health policymaking (STP): 8. Deciding how much confidence to place in a systematic review. *Health Research Policy and Systems* 2009; 7 (Suppl1): S8.)

For primary research (if included), we documented the dimension of the organizing framework with which it aligns, publication date, jurisdiction studied, methods used, a description of the sample and intervention, declarative title and key findings, and equity considerations using PROGRESS PLUS. We then used this extracted information to develop a synthesis of the key findings from the included syntheses and primary studies.

During this process we include published, pre-print and grey literature. We do not exclude documents based on the language of a document. However, we are not able to extract key findings from documents that are written in languages other than Chinese, English, French, Portuguese or Spanish. We provide any documents that do not have content available in these languages in an appendix containing documents excluded at the final stages of reviewing. We excluded documents that did not directly address the research questions and the relevant organizing framework. All of the information provided in the appendix tables was taken into account by the authors in describing the findings in the rapid synthesis.

### **Identifying experiences from other countries and from Canadian provinces and territories**

For each rapid synthesis, we work with the requestor and a subject matter expert to collectively decide on what countries (and/or states or provinces) to examine based on the question posed. For other countries we searched relevant government and stakeholder websites, including ministries of health, other government agencies and cancer care or primary-care organizations working to strengthen cancer care. In Canada, a similar approach was used, which involved searching the websites of ministries of health, other government agencies and organizations and networks working to strengthen cancer care. While we do not exclude countries based on language, where information is not available in English, Chinese, French, Portuguese or Spanish, we attempt to use site-specific translation functions or Google Translate.

## Appendix 2: Key findings from highly relevant jurisdictional experiences on transitions into and out of cancer care systems for patients who do not have a primary-care provider

Table 1: Experiences in other countries on transitions into and out of cancer care systems for patients who do not have a primary-care provider

Jurisdiction	Summary of findings
Australia	<ul style="list-style-type: none"> <li>In Australia, patients are <a href="#">not registered with a specific general practice</a> and may choose which practice to attend on each occasion and information about individual's health and previous use of health services is contained within the Australian <a href="#">My Health Record system</a></li> <li>Cancer Australia is working on the expansion of multidisciplinary teams run out of regional cancer centres that involve many different professionals; <a href="#">select pilots</a> of this approach have involved a representative from the local Division of General Practice, who can support planning for care transitions for patients <ul style="list-style-type: none"> <li>Changes during the pandemic to <a href="#">virtual multidisciplinary team meetings</a> have improved the attendance of primary-care providers</li> <li>The pandemic has also spurred an <a href="#">expansion of shared care</a> (as some patients were unable to visit a cancer centre) between a specialist and a general practitioner using telehealth services and shared online consultations</li> </ul> </li> <li>To support greater involvement of primary-care providers in cancer care (and ultimately the transition out of cancer care), Cancer Australia developed <a href="#">evidence-based guides</a> for select cancer types that detail roles for different health professionals</li> </ul>
Denmark	<ul style="list-style-type: none"> <li>None identified</li> </ul>
France	<ul style="list-style-type: none"> <li>None identified</li> </ul>
Germany	<ul style="list-style-type: none"> <li>None identified</li> </ul>
New Zealand	<ul style="list-style-type: none"> <li>No relevant findings directly related to the transitions into and out of cancer care systems for patients without primary-care providers were identified; however, some key features were noted with respect to primary and cancer care: <ul style="list-style-type: none"> <li>The <a href="#">Medical Oncology National Implementation Plan</a> brought forth a new model of care that emphasized the role of primary-care clinicians in cancer care and treatment</li> <li>In New Zealand, cancer care <a href="#">navigators</a> provide residents and their families with support to help with the coordination of care between primary-care facilities and hospitals</li> <li>The health system in New Zealand has a <a href="#">‘hub-and-spoke’</a> model that helps to deliver palliative care in rural and remote areas; a feature of this model is that it connects primary healthcare teams with oncology specialists</li> </ul> </li> </ul>
Sweden	<ul style="list-style-type: none"> <li>None identified</li> </ul>
United Kingdom (U.K.)	<ul style="list-style-type: none"> <li>In the U.K., <a href="#">primary care networks</a> (PCNs) consist of GP practices working together with mental health, social care, pharmacy, hospital and voluntary services in their local areas as multidisciplinary group practices, collectively responsible for the health and well-being of the communities they serve</li> <li>The <a href="#">Additional Roles Reimbursement Scheme</a> was introduced in England in 2019 to help improve access to general practice, allowing PCNs to claim reimbursement for salaries of 17 new roles within primary-care multidisciplinary teams to meet local population needs <ul style="list-style-type: none"> <li>Many PCNs leverage this scheme to hire <a href="#">cancer care coordinators</a> who assist patients with personalized care planning and support throughout the cancer pathway, helping to ensure that patients receive required cancer care from PCNs</li> </ul> </li> <li>Some cancer centres in the U.K., such as the <a href="#">Children's and Teenage Oncology and Haematology Unit</a> at the Leeds Teaching Hospitals, <a href="#">coordinate with local hospitals, children's community nursing teams, and general practitioners</a> to enhance access to cancer care services that need not be provided at specialist centres</li> </ul>

Jurisdiction	Summary of findings
	<ul style="list-style-type: none"> <li>○ Patients meet monthly with a <a href="#">Macmillan nurse</a> (specialist cancer nurses) to <a href="#">update and communicate shared treatment plans</a>, including to local primary-care providers that can help support cancer care</li> </ul>
<b>United States (U.S)</b>	<ul style="list-style-type: none"> <li>• The <a href="#">ACS CARES™</a> (Community Access to Resources, Education, and Support) developed by the American Cancer Society provides newly diagnosed individuals with access to customized guidance, 24/7 over-the-phone support, and both virtual and in-person support from trained community volunteers <ul style="list-style-type: none"> <li>○ They also provide resources for finding a <a href="#">cancer navigator</a></li> </ul> </li> <li>• George Washington University developed the <a href="#">Patient Navigation Barriers and Outcomes Tool (PN-BOT™)</a> that helps with data management and reporting for oncology patient navigation programs in the U.S.</li> <li>• The Association of Community Cancer Centers developed a <a href="#">cancer care patient navigation program toolkit</a></li> <li>• The <a href="#">Mayo Clinic Comprehensive Cancer Center</a> provides free navigation services for patients enrolled at their clinics, which includes navigators who can provide information on cancer care, employment, financial assistance, insurance, local community resources, lodging options, support resources and transportation options</li> <li>• The 2005 <a href="#">Institute of Medicine</a> report From Cancer Care to Cancer Survivor: Lost in Transition indicated four components for cancer care transition models: prevention, surveillance, interventions for treatment, and care coordination between specialists and primary-care providers</li> </ul>

DeMaio P, Waddell K, Bain T, Alam S, Dass R, Cura J, Ali A, Bhuiya A, Wilson M. Rapid synthesis: Approaches to support transitions into and out of cancer care systems for patients who do not have a primary-care provider. Hamilton: McMaster Health Forum, 13 October 2023.

The rapid-response program through which this synthesis was prepared is funded by the Canadian Partnership Against Cancer. The McMaster Health Forum receives both financial and in-kind support from McMaster University. The views expressed in the rapid synthesis are the views of the authors and should not be taken to represent the views of the Canadian Partnership Against Cancer or McMaster University. The authors would like to thank Naheed Dosani and Sian Shuel for their feedback and insightful comments.
