Health impacts of sexual orientation, gender identity, gender expression change efforts, and so-called “conversion therapy” on 2SLGBTQI+ populations

27 March 2024

[MHF product code: RS 120]

Appendix 1: Methodological details

Background to the rapid synthesis

This rapid synthesis mobilizes both global and local research evidence about a question submitted to the McMaster Health Forum’s Rapid Response program. Whenever possible, the rapid synthesis summarizes evidence drawn from existing evidence syntheses and from single research studies in areas not covered by existing evidence syntheses and/or if existing evidence syntheses are old or the science is moving fast. A systematic review is a summary of studies addressing a clearly formulated question that uses systematic and explicit methods to identify, select and appraise research studies, and to synthesize data from the included studies. The rapid synthesis does not contain recommendations, which would have required the authors to make judgments based on their personal values and preferences.

The Forum produces timely and demand-driven contextualized evidence syntheses such as this one that address pressing health and social system issues faced by decision-makers (see [our website](#) for more details and examples). This includes evidence syntheses produced within:

- days (e.g., rapid evidence profiles or living evidence profiles)
- weeks (e.g., rapid syntheses that at a minimum include a policy analysis of the best-available evidence which can be requested in a 10-, 30-, 60-, or 90-business-day timeframe)
- months (e.g., full evidence syntheses or living evidence syntheses with updates and enhancements over time)

This rapid synthesis was prepared over a 30-business day timeframe and involved four steps:

- 1) submission of a question from a policymaker or stakeholder (in this case, Public Health Agency of Canada)
- 2) engaging subject matter expert
- 3) identifying, selecting, appraising, and synthesizing relevant research evidence about the question
- 4) drafting the rapid synthesis in such a way as to present concisely and in accessible language the research evidence.

Engaging subject matter experts

At the beginning of each rapid synthesis and throughout its development, we engage a subject matter expert who helps us to scope the question and ensure relevant context is taken into account in the summary of the evidence.

Identification, selection, quality appraisal and synthesis of evidence

For this rapid synthesis, we searched Health Systems Evidence and the Cochrane Library for evidence syntheses and protocols for evidence syntheses that are underway, as well as PubMed for evidence syntheses and single studies. In Health Systems Evidence and the Cochrane Library, we searched for evidence syntheses using “conversion therapy” OR “gender expression” OR “gender identity” OR “gender change” in the open search field. In Cochrane Library, we searched for “conversion therapy.” Lastly, in PubMed, we searched for ((((((gender identity[MeSH Terms]) OR (Gender-Nonconforming Persons[MeSH Terms])) OR (Gender Dysphoria[MeSH Terms])) OR (homosexuality[MeSH Terms])) AND (((((((((((((((((((((((((((((((((((((((conversion therapy practices[Title/Abstract] OR (conversion practices[Title/Abstract])) OR (sexual orientation[Title/Abstract] AND gender identity change efforts[Title/Abstract])) OR (SOGIECE[Title/Abstract])) OR (SOGICE[Title/Abstract])) OR (conversion practices[Title/Abstract])) OR (ex-gay ministry[Title/Abstract])) OR (ex-trans ministry[Title/Abstract])) OR (sexual orientation change efforts[Title/Abstract])) OR (SOCE[Title/Abstract])) OR (sexual orientation distress[Title/Abstract] AND change efforts[Title/Abstract])) OR (gender identity change efforts[Title/Abstract])) OR (GICE[Title/Abstract])) OR (SOGIE change practices[Title/Abstract])) OR (reparation theory[Title/Abstract])) OR (reparative therapy of homosexuality[Title/Abstract])) OR (sexual reorientation therapy[Title/Abstract])) OR (reorientation therapy[Title/Abstract])) OR (aversion therapy[Title/Abstract])) OR (reintegrative therapy[Title/Abstract])) OR (gay care therapy[Title/Abstract])) OR (conversion act*[Title/Abstract])) OR (LGBT psychiatry[Title/Abstract])) OR (ex-ex-gay[Title/Abstract])) OR (sexual reorientation therapy*[Title/Abstract])) OR (reorientation therapy[Title/Abstract])) OR (reorientation treatment[Title/Abstract])) OR (reorientation psychotherapy[Title/Abstract])) OR (reorientation treatment[Title/Abstract])) OR (reorientation psychotherapy[Title/Abstract])) OR (change allowing therap*[Title/Abstract])) OR (transformational ministry[Title/Abstract])) OR (undesired same-sex sexual attraction[Title/Abstract])) OR (gay conversion therapy[Title/Abstract])) OR (sexual orientation therapy[Title/Abstract])) OR (sexual conversion therapy[Title/Abstract])) OR (cure therapy[Title/Abstract])) OR (gay cure[Title/Abstract])) OR (gay cure therapy[Title/Abstract])) OR (dehomosexualization[Title/Abstract])) OR (conversion therap*[Title/Abstract])) OR (Gender-Affirming Care[MeSH Major Topic])).

Each source for these documents is assigned to one team member who conducts hand searches (when a source contains a smaller number of documents) or keyword searches to identify potentially relevant documents. A final inclusion assessment is performed both by the person who did the initial screening and the lead author of the rapid synthesis, with disagreements resolved by consensus or with the input of a third reviewer on the team. The team uses a dedicated virtual channel to discuss and iteratively refine inclusion/exclusion criteria throughout the process, which provides a running list of considerations that all members can consult during the first stages of assessment.

For any included guidelines, two reviewers assess each guideline using three domains in the AGREE II tool (stakeholder involvement, rigour of development, and editorial independence). Guidelines are classified as high quality if they were scored as 60% or higher across each of these domains.

For each evidence synthesis we included, we documented the dimension of the organizing framework with which it aligns, key findings, living status, methodological quality (using AMSTAR), last year the literature was searched (as an indicator of how recently it was conducted), availability of GRADE profile, and equity considerations using PROGRESS PLUS.

For AMSTAR, two reviewers independently appraise the methodological quality of evidence syntheses that are deemed to be highly relevant. Disagreements are resolved by consensus with a third reviewer if needed. AMSTAR rates overall methodological quality on a scale of 0 to 11, where 11/11 represents a review of the highest quality. High-quality evidence syntheses are those with scores of eight or higher out of a possible 11, medium-quality evidence syntheses are those with scores between four and seven, and low-quality evidence syntheses are those with scores less than four. It is important to note that the AMSTAR tool was developed to assess evidence syntheses focused on clinical interventions, so not all criteria apply to those pertaining to health-system arrangements or to economic and social responses. Where the denominator is not 11, an aspect of the tool was considered not relevant

by the raters. In comparing ratings, it is therefore important to keep both parts of the score (i.e., the numerator and denominator) in mind. For example, an evidence synthesis that scores 8/8 is generally of comparable quality to another scoring 11/11; both ratings are considered 'high scores.' A high score signals that readers of the evidence synthesis can have a high level of confidence in its findings. A low score, on the other hand, does not mean that the evidence synthesis should be discarded, merely that less confidence can be placed in its findings and that it needs to be examined closely to identify its limitations. (Lewin S, Oxman AD, Lavis JN, Fretheim A. SUPPORT Tools for evidence-informed health Policymaking (STP): 8. Deciding how much confidence to place in a systematic review. *Health Research Policy and Systems* 2009; 7 (Suppl1): S8.)

For primary research (if included), we documented the dimension of the organizing framework with which it aligns, publication date, jurisdiction studied, methods used, a description of the sample and intervention, declarative title and key findings, and equity considerations using PROGRESS PLUS. We then used this extracted information to develop a synthesis of the key findings from the included syntheses and primary studies.

During this process we include published, pre-print, and grey literature. We do not exclude documents based on the language of a document. However, we are not able to extract key findings from documents that are written in languages other than Chinese, English, French, Portuguese, or Spanish. We provide any documents that do not have content available in these languages in an appendix containing documents excluded at the final stages of reviewing. We excluded documents that did not directly address the research questions and the relevant organizing framework. All of the information provided in the appendix tables was taken into account by the authors in describing the findings in the rapid synthesis.

Appendix 2: Detailed data extractions from evidence syntheses about the health impacts of sexual orientation, gender identity, gender expression change efforts and so-called “conversion therapy” on 2SLGBTQI+ populations
