## Exploring female-dominant conditions among military personnel and Veterans in each of the 'Five Eyes' countries

**5 February 2024**

[MHF product code: REP 66]

## Appendix 1: Methodological details

We use a standard protocol for preparing rapid evidence profiles (REP) to ensure that our approach to identifying research evidence is as systematic and transparent as possible in the time we were given to prepare the profile.

### Engaging subject matter experts

At the beginning of each rapid evidence profile and throughout its development, we engaged two subject matter experts, who helped us to scope the question and ensure relevant context is considered in the summary of the evidence.

### Identifying research evidence

For this REP, we searched Health Systems Evidence, PubMed and Forces in Mind research repository for:

- 1) evidence syntheses
- 2) protocols for evidence syntheses that are underway
- 3) single studies related to Canadian military personnel and Veterans.

We searched [Health Systems Evidence](#) using open search terms for (woman OR women OR female) AND (military OR Veteran). In [PubMed](#), we used an open search for (woman OR women OR female) AND (prevalence OR incidence OR burden) AND (condition or disorder) AND (military OR veteran). We applied filters for the last 10 years and for systematic reviews and other reviews. For single studies in [PubMed](#), we used an open search for (woman OR women OR female) AND (prevalence OR incidence OR burden) AND (condition or disorder) AND (military OR veteran) AND (Canada OR Canadian) and a filter for the last 10 years. In the [Forces in Mind research centre](#), we used the following search terms (woman OR women OR female). Links provide access to the full search strategy.

Each source for these documents is assigned to one team member who conducts hand searches (when a source contains a smaller number of documents) or keyword searches to identify potentially relevant documents. A final inclusion assessment is performed both by the person who did the initial screening and the lead author of the rapid evidence profile, with disagreements resolved by consensus or with the input of a third reviewer on the team. The team uses a dedicated virtual channel to discuss and iteratively refine inclusion/exclusion criteria throughout the

process, which provides a running list of considerations that all members can consult during the first stages of assessment.

During this process we include published, pre-print and grey literature. We do not exclude documents based on the language of a document. However, we are not able to extract key findings from documents that are written in languages other than Chinese, English, French or Spanish. We provide any documents that do not have content available in these languages in an appendix containing documents excluded at the final stages of reviewing. We excluded documents that did not directly address the research questions and the relevant organizing framework.

### **Assessing relevance and quality of evidence**

We assess the relevance of each included evidence document as being of high, moderate or low relevance to the question.

Two reviewers independently appraised the quality of the guidelines we identified as being highly relevant using AGREE II. We used three domains in the tool (stakeholder involvement, rigour of development and editorial independence) and classified guidelines as high quality if they were scored as 60% or higher across each of these domains.

Two reviewers independently appraise the methodological quality of evidence syntheses that are deemed to be highly relevant. Disagreements are resolved by consensus with a third reviewer if needed. AMSTAR rates overall methodological quality on a scale of 0 to 11, where 11/11 represents an evidence synthesis of the highest quality. High-quality evidence syntheses are those with scores of eight or higher out of a possible 11, medium-quality evidence syntheses are those with scores between four and seven, and low-quality evidence syntheses are those with scores less than four. It is important to note that the AMSTAR tool was developed to assess evidence syntheses focused on clinical interventions, so not all criteria apply to those pertaining to health-system arrangements or to economic and social responses. Where the denominator is not 11, an aspect of the tool was considered not relevant by the raters. In comparing ratings, it is therefore important to keep both parts of the score (i.e., the numerator and denominator) in mind. For example, an evidence synthesis that scores 8/8 is generally of comparable quality to another scoring 11/11; both ratings are considered 'high scores.' A high score signals that readers of the evidence synthesis can have a high level of confidence in its findings. A low score, on the other hand, does not mean that the evidence synthesis should be discarded, merely that less confidence can be placed in its findings and that the evidence synthesis needs to be examined closely to identify its limitations. (Lewin S, Oxman AD, Lavis JN, Fretheim A. SUPPORT Tools for evidence-informed health Policymaking (STP): 8. Deciding how much confidence to place in a systematic review. *Health Research Policy and Systems* 2009; 7 (Suppl1): S8.)

### **Identifying experiences from other countries and from Canadian provinces and territories**

For each REP, we work with the requestors and a subject matter expert to collectively decide on what countries (and/or states or provinces) to examine based on the question posed. For other countries, we search relevant government and stakeholder websites including websites for departments and offices of Veterans' affairs. In Canada, a similar approach was used, searching the website of Veterans Affairs Canada as well as websites of provincial and territorial ministries of health. While we do not exclude content based on language. Where information is not available in English, Chinese, French or Spanish, we attempt to use site-specific translation functions or Google Translate. A full list of websites and organizations searched is available upon request.

### **Preparing the profile**

Each included document is cited in the reference list at the end of the REP. For all included guidelines, evidence syntheses and single studies (when included), we prepare a small number of bullet points that provide a summary of the key findings, which are used to summarize key messages in the text. Protocols and titles/questions have their titles hyperlinked, given that findings are not yet available.

We then draft a summary that highlights the key findings from all highly relevant documents (alongside their date of last search and methodological quality) as well as key findings from the jurisdictional scan.

Upon completion, the REP is sent to the subject matter expert for their review.

## Appendix 2: Summary of key findings from highly relevant evidence documents organized by condition

Health risk or condition	Summary of key findings
<ul style="list-style-type: none"> <li>Communicable disease</li> </ul>	<ul style="list-style-type: none"> <li>No literature identified</li> </ul>
<ul style="list-style-type: none"> <li>Non-communicable disease</li> </ul>	<ul style="list-style-type: none"> <li>One recent low-quality evidence synthesis found that post-deployment health risks for females in the military include gastrointestinal disorders, increased cardiovascular disease rates, and chronic pain, all of which occur at a higher rate than among female civilians (1)</li> <li>One recent single study of Canadian Veterans found female Veterans were more likely than males to report migraines and gastrointestinal disorders, including bowel disorders and ulcers (2)</li> <li>One recent single study of Canadian Veterans living in Ontario found female Veterans are more likely to experience higher incidences of asthma (3)</li> </ul>
<ul style="list-style-type: none"> <li>Pregnancy and obstetric conditions and diseases</li> </ul>	<ul style="list-style-type: none"> <li>One recent low-quality evidence synthesis reported that female Veterans had increased risk of pre-term birth, preeclampsia and gestational diabetes as compared to their civilian counterparts (4) <ul style="list-style-type: none"> <li>Though the pathway from deployment to birth outcomes is uncertain, PTSD is being examined as one possible link (4)</li> </ul> </li> </ul>
<ul style="list-style-type: none"> <li>Maternal health and related conditions</li> </ul>	<ul style="list-style-type: none"> <li>One recent low-quality evidence synthesis and one recent single study found a high prevalence of perinatal depression in military women compared to their civilian counterparts (ranging from 4.6 to 50.7%), with deployment status identified as a significant risk factor (5; 6)</li> </ul>
<ul style="list-style-type: none"> <li>Other reproductive and gynecological conditions</li> </ul>	<ul style="list-style-type: none"> <li>One low-quality recent evidence synthesis found that females serving in the military face distinct challenges during and after the completion of service, in particular, a lack of bathrooms can lead to poor vaginal hygiene and elevated rates of vaginitis and urinary tract infection when compared to female civilians (1)</li> <li>One recent low-quality evidence synthesis included one study that identified higher rates of long-acting reversible contraceptive among active duty women (7)</li> <li>One recent single study of Canadian Armed Forces members found female members are more likely to experience urinary incontinence and pelvic organ prolapse, particularly among those with physically demanding roles (8)</li> </ul>
<ul style="list-style-type: none"> <li>Musculoskeletal conditions</li> </ul>	<ul style="list-style-type: none"> <li>One recent medium-quality evidence synthesis found an increased risk of musculoskeletal injuries, stress fractures and general injuries among female serving military members compared to men (9) <ul style="list-style-type: none"> <li>The synthesis found female recruits are generally at a higher risk for stress fractures compared to female active military personnel</li> </ul> </li> <li>One older single study of Canadian Armed Forces Members found higher rates of musculoskeletal problems and back problems among women as compared to men (10)</li> <li>One older single study of Canadian Veterans reported that though male Veterans were more likely to report consistent or recurrent chronic pain, female Veterans were more likely to report moderate to extreme pain interferences with work, with females aged 40 to 49 reporting the highest percentages (11)</li> <li>One recent single study of Canadian Veterans living in Ontario found they experience a higher incidence of rheumatic arthritis compared to male Veterans (3)</li> </ul>
<ul style="list-style-type: none"> <li>Mental health and related conditions</li> </ul>	<p><i>Mental health conditions (general)</i></p> <ul style="list-style-type: none"> <li>One recent single study of Canadian Armed Forces members reported that females were more likely to experience co-morbid mental health conditions as compared to their male counterparts, with the most frequent being major depression and PTSD (12)</li> <li>One older single study of Canadian Armed Forces members reported women, older people and junior non-commissioned officers were more likely to experience moderate mental health conditions than other military personnel (10)</li> <li>One older single study of Canadian Veterans found female Veterans were more likely to report diagnosed mood and anxiety disorders as compared to male Veterans (2)</li> <li>One older single study of Canadian Veterans found that female Veterans had higher rates of mental health conditions compared to male Veterans (13)</li> </ul>

Health risk or condition	Summary of key findings
	<p><i>Post-traumatic stress disorder (PTSD)</i></p> <ul style="list-style-type: none"> <li>Two recent low-quality evidence syntheses reported that women Veterans had higher probability of developing PTSD as compared to men (7; 14) <ul style="list-style-type: none"> <li>The recent low-quality evidence synthesis noted that statistically significant associations in decreasing order of strength for developing PTSD were: sexual assault, feeling in danger of being killed, sexual harassment, and witnessing someone else being killed or injured (7)</li> </ul> </li> <li>One recent single study of Canadian Forces members and Veterans found females, junior commissioners and land officers who have experienced previous trauma have a higher likelihood of experiencing PTSD than male or other occupational members (10)</li> <li>One recent single study of Canadian Armed Forces members found that although men and women experience similar exposures to traumatic events during their military careers, women were twice as likely to develop PTSD (15)</li> <li>A second single study of the Canadian Armed Forces and Canadian Veterans found females were more likely to experience illness-induced PTSD as compared with males, and were more likely to experience persistent symptoms of PTSD than other sub-groups (16)</li> <li>One recent single study of U.S. Veterans found female Veterans were more likely to experience PTSD, depression and suicidal thoughts than male Veterans (17)</li> </ul> <p><i>Depression</i></p> <ul style="list-style-type: none"> <li>One recent low-quality evidence synthesis reported that women with a history of military service exhibited higher rates of diagnosed depression than those who had not served as well as a higher incidence ratio as compared to men across all military services (7) <ul style="list-style-type: none"> <li>The evidence synthesis noted that depression is also frequently correlated with other mental health conditions including PTSD symptomology (7)</li> <li>The evidence synthesis reported on results from a longitudinal cohort study and found female soldiers were more likely to attempt suicide than men in any deployment status (never deployed, currently deployed or previously deployed) with the highest odds occurring for those while on current deployment (7)</li> </ul> </li> <li>One recent single study of Canadian Armed Forces members found females to have higher rates of major depression, with individuals working in Joint Personnel Support Units having notably higher rates of diagnoses while technicians and Air Force members had relatively low rates (18)</li> </ul> <p><i>Suicide</i></p> <ul style="list-style-type: none"> <li>One older low-quality evidence synthesis reported that female Veterans using Veterans Affairs services were disproportionately likely to commit suicide as compared to male Veterans using Veterans Affairs services, who were more likely to attempt suicide (19)</li> </ul> <p><i>Substance use problems and disorders</i></p> <ul style="list-style-type: none"> <li>One older medium-quality evidence synthesis found substance rates were generally higher in male than in female Veterans, although one study reported comparable or higher rates of heavy drinking in female compared to male National Guard and reserve members (20)</li> <li>One recent single study found that although male Veterans were more likely to report substance use, drug use was found to predict greater severity of PTSD in female Veterans (21)</li> </ul>
<ul style="list-style-type: none"> <li>Medically unexplained symptoms</li> </ul>	No literature was identified
<ul style="list-style-type: none"> <li>Other female-dominant health risks</li> </ul>	<p><i>Eating disorders or distorted eating</i></p> <ul style="list-style-type: none"> <li>One older low-quality and one recent low-quality evidence synthesis found rates of eating disorders are higher among female active service members and Veterans than their male counterparts, but the older low-quality synthesis noted that these rates were comparable to the general populations (22; 23) <ul style="list-style-type: none"> <li>The recent low-quality evidence synthesis emphasized the impact of military-related trauma, adverse childhood experiences, and military fitness testing on the development of eating disorders (23)</li> </ul> </li> </ul>

Health risk or condition	Summary of key findings
	<ul style="list-style-type: none"> <li>One older single study of Canadian Veterans found female Veterans had higher rates of eating disorders than male Veterans, with younger female Veterans, those with PTSD and those with depression at particularly high risk (24)</li> </ul> <p><i>Sleep disturbances</i></p> <ul style="list-style-type: none"> <li>One recent low-quality evidence synthesis reported that female military members exhibited a higher prevalence of insomnia compared to civilian women and male military members (25) <ul style="list-style-type: none"> <li>The evidence synthesis noted that insomnia was associated with a variety of co-morbidities including depression, PTSD, hypertension and diabetes and were more frequently observed among female military members than in civilian women or male military members (25)</li> </ul> </li> </ul> <p><i>Military sexual trauma</i></p> <ul style="list-style-type: none"> <li>An older medium-quality evidence synthesis revealed that 15.7% of military personnel and Veterans report military sexual trauma, with a significantly higher portion of females reporting both assault (23.6% of female military personnel and Veterans compared to 1.9% of male) and harassment (52.5% of female and 8.9% male) (26) <ul style="list-style-type: none"> <li>A recent low-quality evidence synthesis noted that military sexual trauma has a number of adverse consequences including both mental and physical health conditions, namely associated with the onset of both PTSD and depression, chronic illnesses including increased risk of diabetes mellitus, hypertension, obesity and cardiovascular risk factors, and reproductive health challenges including sexual dysfunction disorder, sexually transmitted infections, infertility and perinatal depression (27)</li> </ul> </li> <li>One recent single study of Canadian Armed Forces members and one older single study of Canadian military personnel found females are significantly more likely to experience military sexual trauma than males (28; 29) <ul style="list-style-type: none"> <li>The recent single study noted that this rate was higher in younger females, those with lower incomes, and those with a history of deployment or serving in air units (28), while the older study noted that risk factors included being single, a senior non-commissioner, or living in a Western region (29)</li> </ul> </li> </ul>
